

# Assess

Turn-key apps testing for Windows

A cloud-based platform with several flavours of Windows platforms, including Insider Builds, for detailed ad-hoc testing of applications and packages.

Application testing is a necessary and fundamental component for ISVs as well as for businesses that rely on a working IT infrastructure in their daily work. Failure to operate a single application, or its incompatibility with other applications or Windows platforms, may result in the failure of the entire system.

Apptimized Assess offers numerous platforms for individual tests. We inform you about the life cycle of Windows platforms to help you to get an overview of the currently supported versions. In addition, the list of platforms is updated regularly. We monitor both the release of new versions and the insider builds to not only notify you, but also to provide them in time for testing.

## BENEFITS TO YOUR ORGANIZATION

### Easy manual testing

Our comprehensive Assess tool allows you to test both applications and packages quickly and easily on an environment that has already been prepared.

### Test in Cloud

Testing in the cloud acts as a remote simulator of your working environment, allowing you to make the test more practical.

### Stay modern

You will be able to test on all current OS's and be prepared for a new version release, while conducting a test on Insider Builds.

## Key Product Features

### Keep in mind real conditions

Some applications cannot work independently. Firstly, you must configure the operation of interrelated components. Prerequisites will make it possible to establish dependencies between applications and allow to conduct a test case accurately.

### Generate reports

Each step that was performed by the tester in the process of testing the application is recorded. Before uploading the results, you can edit the recorded actions and leave internal comments if necessary. In this way, you can get a document in HTML or PDF formats, which describe all the steps of the test case. It will help you to find the problem easily or to reproduce the test case further.

### Virtual machines in your browser

There are no additional requirements for your environment: we offer virtual machines that are already prepared for testing. You can use them any time. All you need is an access to the Internet, and we will provide access to Apptimized 24/7, without restricting users to work.

### Mass testing

If necessary, you can conduct a parallel testing on several virtual machines, without the need to load your local system. Thus, there is no need to waste time while waiting for the program to be installed or the files deploying on the machine.

### Custom reports

Customize the Testing Template according to your requirements and it will automatically be applied to documents with test cases that are already completed. This will allow you to get a template that matches your internal documents.

### Easy access to the latest Windows build

There is no need to monitor updates provided by Microsoft. As soon as the new insider build is released, you will receive a notification that it is already available for your tests.

### Azure integration

If you have previously worked with the Azure Virtual Machines, there is no need to suspend this process. It is enough to configure them so that they can be displayed in the Apptimized system. You will also be able to run additional tests on them if necessary.

### Testing made easy

User-friendly interface allows you to quickly understand the requirements of the system and immediately begin testing. So, depending on the complexity of the test case, its passage might take no more than 10 minutes of your time.
