

# Catalogue

Stay secure and compliant with automated app update notifications and packages

A list of most common business applications - keeps reminding you on updates and provides best practice packages within 24 hours after release.

Timely software update to the current version is one of the key needs of a company's technical support department. In order to keep everything under control, you must either subscribe to the update of each application on the official website or carry out regular self-testing. Unfortunately, each of the options is laborious and does not solve the problem entirely.

Access to the catalogue will keep you notified on new vendor releases and provide you with the opportunity to download the packaged version within 24 hours. All well-known formats such as e.g. MSI or App-V are supported.

## BENEFITS TO YOUR ORGANIZATION

### Fast simple packages

Cost savings for standard software packaging, if you do not have specific requirements for custom packaging.

### Update on time

The new version available in the Catalogue appears within the first 24 hours after the release, so you do not lose time for a long waiting.

### Secured packages

Each version of the application and the package undergoes a full cycle of testing from our specialists. It minimizes the risks of installing a malicious application on your company's computers.

## Key Product Features

### Top modern application

More than 150 of the most popular applications are monitored by experts so that you do not miss the release of the new version. As soon as the announcement will be available on the official website of the vendor, you will receive a notification in the mail that the version is available for download. At the same time, we also keep previous versions of applications for you, which means that you get full access to the version database and can download and install the previous one at any time.

### Zero vulnerabilities

However, before providing vendor software, each application is checked for viruses, so you do not need to go through an independent testing phase, so you can proceed directly to installation. Any possibly found vendor vulnerabilities will also be available for viewing.

### Package updates

More than 30 popular applications will be available for downloading as packages for installation within the first 24 hours after the update. In the process of packaging, the best projects are applied as well as various most common technologies such as MSI and App-V, based on 15 years of experience in the field of software packaging.

### Configure updates options

If the application has several update branches, set the notification in such a way as not to miss the release of each of them. In addition, a flexible notification system allows you to self-configure a person who is going to be responsible for new versions of applications and/or packages. Select only those applications from the list that are used in your company and the information about which you want to receive.

### Stay updated

A report about applications with their current status and other additional information you monitor are always available for downloading in a convenient format.
